Purpose of the Game

Teach your kids about supply and demand by showing them that the price of dinner can change when there are less items available.

Supplies

- Scissors
- Play money or coins
- Pencil

Directions

1. Cut out the food items provided.
2. Arrange each food item in rows, one to a box.
3. Put one food item in each box so that each row has four of the same food item. The cost of the items in one row of identical food items must equal 60 cents. As items are purchased, the cost of each dinner item will change in order for the cost for the whole row to add to 60 cents.
4. The first round, each item is the same price (15 cents). Give your child 60 cents or 60 in any play money, and ask them to “spend” it for dinner. Also spend your money to buy items for dinner.
5. The next round, “restock” the rows with one item each. Rows with items that were not purchased in the previous round will now have 5 items. Items where two or more were purchased will have 3 or less. Make the rows add up to 60 by changing the cost of items. If the row of icecream is understocked with 3 items, each will now cost 20 cents. If the row of broccoli is overstocked with 5, each will now cost 12 cents.
6. Each player gets 60 more cents, and buys again.
7. Continue through four rounds, and count the number of items you and your child each bought to see who has the most for dinner!
